PRODUCT STRUCTURE:

WHAT IS SPC VINYL FLOORING?

SPC vinyl flooring, or Stone Plastic Composite vinyl flooring, is a type of rigid core flooring designed for durability and easy maintenance. It is made by combining limestone and stabilizers with PVC (polyvinyl chloride) to create a solid core material that provides several benefits. SPC vinyl flooring is one of the best alternatives for floors with high foot traffic, such as hotels or offices, although it is also used in the domestic environment.

KEY BENEFITS

1. Waterproof and Moisture Resistance:

SPC flooring is completely waterproof, making it an excellent choice for bathrooms, kitchens, laundry rooms, and basements where moisture can be a concern. Its rigid core prevents warping or swelling when exposed to water.

2. Durability:

The stone-plastic composite core makes SPC vinyl flooring much more durable than traditional vinyl. It's resistant to impacts, heavy foot traffic, and even furniture dents. This makes it suitable for both residential and commercial use.

3. Stability:

Unlike traditional vinyl flooring, SPC won't expand or contract with changes in temperature or humidity. This stability makes it a great option for homes with fluctuating climates or areas with high humidity.

4. Comfort:

Though it's a rigid core, SPC vinyl tends to be more comfortable underfoot compared to harder surfaces like stone or ceramic tiles. The added underlayment (if included) helps with sound absorption, reducing footstep noise.

5. Scratch and Stain Resistant:

The top wear layer provides protection against scratches, stains, and scuffs, making SPC vinyl flooring ideal for households with pets, children, or heavy foot traffic.

6. Low Maintenance:

SPC flooring is easy to clean with a simple sweep or mop. Unlike hardwood or carpet, it doesn't require regular sealing or waxing.

7. Easy Installation:

Many SPC flooring products feature click-lock installation systems that make it DIY-friendly. It can be installed over most existing floors, saving time and money compared to traditional flooring methods.

8. Eco-Friendly Options:

Some SPC products are made with environmentally friendly materials and are free from harmful chemicals like phthalates and formaldehyde, making them safer for the environment and your home.

Design Versatility

SPC flooring comes in a wide array of styles, including:

- Wood Looks: Realistic wood designs like oak, walnut, and maple, with natural grain textures.
- Stone and Tile Looks: Designs that mimic stone and ceramic tiles, offering the aesthetic appeal of traditional materials without the coldness or fragility.
- Color Variety: Available in various colors, from light neutrals to bold, dark shades, to suit a variety of interior styles.

Applications of SPC Vinyl Flooring

- Residential: It's an excellent choice for living rooms, bedrooms, kitchens, bathrooms, and hallways in homes.
- Commercial: SPC is also widely used in commercial spaces like offices, retail stores, and healthcare facilities due to its durability, ease of maintenance, and water resistance.
- High-Traffic Areas: Its robust nature makes it ideal for places with heavy foot traffic, such as schools, restaurants, and hotels.

Considerations When Choosing SPC Flooring

- Installation Subfloor: Make sure your subfloor is clean, dry, and level before installation. Any imperfections can affect the final result.
- Acclimation: SPC flooring should be acclimated to the room temperature for 48 hours before installation to ensure proper expansion and contraction.
- Subtle Color Variations: While the high-definition prints are realistic, some SPC floors may exhibit slight color variation from plank to plank, so check the color consistency before installation.

FAQs

1.Can SPC floors be installed over existing tiles?

Yes, SPC flooring can be installed over tiles, provided the surface is level and in good condition.

2.Is underlayment necessary for SPC rigid core flooring?

While SPC flooring's rigid core reduces the need for underlayment, it can be used for additional soundproofing and insulation.

3.Can SPC flooring be used in high-moisture areas?

Yes, due to its waterproof nature, SPC flooring is suitable for areas like bathrooms and kitchens.

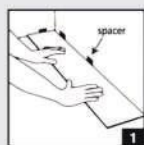

4.How do SPC floors react to temperature changes?

SPC flooring is more stable in temperature changes compared to other vinyl floorings due to its rigid core.

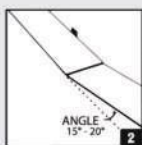

5.Is SPC vinyl flooring pet-friendly?

Yes, SPC vinyl flooring is durable and scratch-resistant, making it suitable for homes with pets.

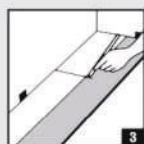

INSTALLATION DIAGRAM

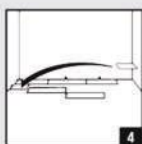

Start at a corner.
Place first plank with tongue side facing wall.
Use spacers to maintain an expansion space of 2-3mm between wall and flooring.

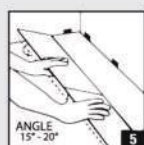

Insert 2nd plank's end tongue to 1st plank's end groove at an angle of 15° to 20°.
The plank will click into place when lowered.
Line up edges carefully.
Planks should be flat to the floor.

For the last plank of a row, flip a full plank to its under side and place beside the row.
Measure and mark the required length.
Use a ruler and utility knife to score the plank and snap off.
Insert as previous diagram.

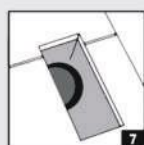

Begin next row with the last cut off piece from the previous row to stagger the pattern.

To start second row, assemble your entire row on the subfloor before attaching it to the first row.
The attach, lift and push the side tongue into the side groove of the first row at an angle of 15° to 20°.
Lower and click into place lining the edges up carefully.
Continue laying remaining planks in this manner.

To fit the final row, lay a plank upside down on the flooring as per diagram with the tongue side close to the wall.
Take another plank and place it right on top of the previous row and use it as a ruler.
Don't forget to allow room for spacers.
Cut the plank and attach into position.

Heating vents require expansion room.
First, cut plank to the correct length.
Place the cut plank at its actual position and use a ruler to measure the areas to be cut out and mark them.
Cut out the marked points allowing the necessary expansion distance.

The gap between the bottom of a door and the flooring should be 1cm height.
To trim door frames, turn a plank upside down.
Place it next to the door frame as per diagram.
Use a handsaw and cut away the necessary height so that the planks can slide easily underneath the frame.
